

Should we consider the users in contextual music auto-tagging models?

Karim M. Ibrahim, Elena Epure, Geoffroy Peeters, Gaël Richard

karim.ibrahim@telecom-paris.fr

https://github.com/KarimMibrahim/user-aware-music-autotagging

influence the listening preferences [1]

The listening context strongly

Contextual tags → Tags that describe the listening situation of the users

(e.g. location, activity, time).

The Question: Would considering the user when auto-tagging tracks with

Playlists

"xyz *gym* xyz" by

user A

Restricted case for

fair comparison

with the

user-based model

(hypothetical

scenario)

I/A

Train two auto-taggers, one using only audio and one using audio+user information.

Collect a dataset of tracks tagged with different contexts by different users.

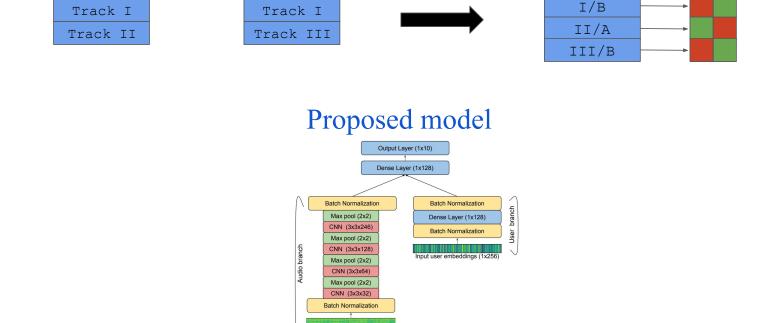

Proposed approach

- 3. Evaluate the two model using different user-focused evaluation protocols.
- How to collect the dataset?

"xyz work xyz" by

user B

"Through the user-created playlists"

output any track egardless of the user

Real-world

use case:

same

predictions for

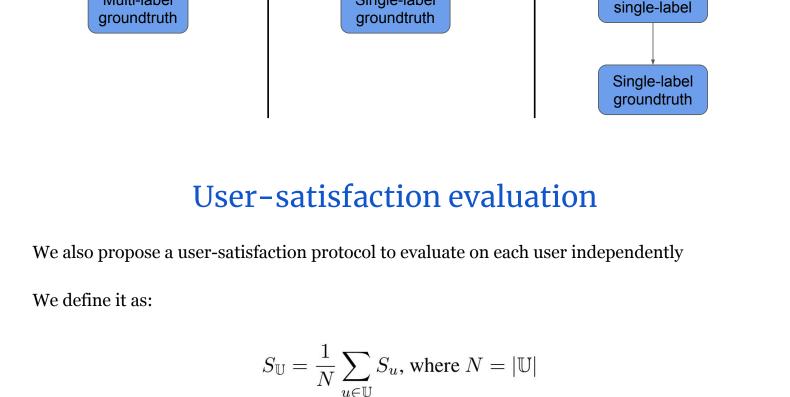

Evaluation Scenarios

We need to compare the **multi-label** audio model to the **single-label** user model. Hence, we convert the audio model output using different scenarios to compare.
